1. Introduction

This project consists of three basic websites developed using HTML and CSS: a Personal Portfolio, Sweet Cake Shop, and College Fest 2026 website. Each website serves a different purpose and demonstrates webpage structure, styling, navigation, content sections, cards, and forms. The project helps build an understanding of front-end web development and presenting information clearly through a website.

2. Objectives

Learn how HTML is used to structure webpage content.

Understand how CSS controls colors, fonts, spacing, and layout.

Create three websites for different practical use cases.

Organize webpage content into clear sections.

Practice using links, cards, and form elements.

Improve basic web design and project organization skills.

3. Tools and Technologies

HTML5

HTML is used to create webpage structure and content, including headings, paragraphs, sections, links, images, lists, and form elements.

CSS3

CSS styles the webpages by controlling colors, backgrounds, typography, spacing, alignment, cards, and overall appearance.

Code Editor and Web Browser

A code editor can be used to write the HTML and CSS files. A browser such as Google Chrome or Microsoft Edge can be used to open and test the webpages. These are static front-end websites and do not require JavaScript or a backend server to display their main content.

4. Project One: Personal Portfolio Website

4.1 Overview

The Personal Portfolio Website introduces the student and presents educational details, skills, interests, projects, and contact information. It can be used as a basic online profile.

4.2 Objectives

Present a short personal introduction.

Display education, skills, and project information.

Provide contact links for communication.

Create a simple and organized personal webpage.

4.3 Main Sections

Home: introduces the portfolio owner.

About: provides a short description and interests.

Skills: lists technical and personal skills.

Projects: shows sample projects completed or designed.

Education: presents degree, college, branch, and year.

Contact: provides email and phone links.

4.4 Design and Implementation

HTML sections and navigation links organize the information. CSS controls layout, typography, spacing, and visual styling. The design uses a purple accent color and a clean layout to make information easy to read.

4.5 Expected Result

When opened in a browser, the website displays a single-page portfolio with navigation and clearly separated sections. Contact links can open the email application or phone dialer when supported by the device.

5. Project Two: Sweet Cake Shop Website

5.1 Overview

The Sweet Cake Shop website is a sample bakery website that presents bakery products and their prices. It gives visitors a simple overview of the shop and its available items.

5.2 Objectives

Display bakery products in an attractive format.

Show product names and prices.

Provide basic shop and contact information.

Practice using product cards and CSS styling.

5.3 Main Sections

Header or navigation: introduces the shop and helps visitors move through the page.

Introduction: presents the bakery.

Products: displays cakes, cupcakes, puffs, samosas, and cookies with sample prices.

Contact: provides basic contact details.

5.4 Design and Implementation

HTML defines product sections and cards. CSS controls colors, spacing, product arrangement, and text styles. Product cards help visitors scan item names and prices quickly.

5.5 Expected Result

The webpage displays a bakery landing page with a collection of products and sample prices. It is a visual catalogue only; unless ordering functionality is implemented, it does not process purchases or payments.

6. Project Three: College Fest 2026 Website

6.1 Overview

The College Fest 2026 website provides information about a college festival. It presents the event title, date, venue, activities, and a registration form layout.

6.2 Objectives

Share essential information about the college fest.

Display the available events clearly.

Present the festival schedule or event details.

Provide a registration form interface for students.

6.3 Main Sections

Header and introduction: displays the College Fest 2026 title.

Event details: shows the planned date and venue.

Events: lists activities such as singing, dancing, coding, and art.

Schedule: presents event timing or sequence where included.

Registration: displays fields for participants to enter details.

6.4 Design and Implementation

HTML provides the page sections, event information, and form fields. CSS styles the event cards, headings, spacing, and overall festival theme.

6.5 Expected Result

The webpage displays college fest information and a registration form interface. A static HTML form does not automatically store or submit registrations unless connected to a suitable form service or backend.

7. General Website Structure

The project files can be organized into separate HTML and CSS files for each website. The following is an example structure; adjust filenames to match the actual files.

```
Three-Website-Projects/
■■■ portfolio.html
■■■ portfolio.css
■■■ bakery.html
■■■ bakery.css
■■■ college-fest.html
■■■ college-fest.css
■■■ README.md
```

8. Testing

Open each webpage in a modern browser and check that the layout and content display correctly.

Check that each HTML file opens without errors.

Check that navigation links point to the correct sections.

Check that text, product cards, event cards, and images appear correctly.

Check email and telephone links.

Check the layout at different browser-window widths.

Check that registration form fields are visible and usable, if present.

Confirm that CSS files and image paths are correct.

9. Limitations

The websites are primarily static and use HTML and CSS only.

The portfolio does not automatically update its information.

The bakery website does not include a shopping cart, payment system, or order database.

The college fest registration form does not save participant details unless connected to a backend or form service.

Responsive behavior depends on the CSS rules included in the actual files.

10. Future Enhancements

Improve responsive layouts for mobile phones and tablets.

Add accessible labels and alternative text for images.

Connect forms to a backend or form service where needed.

Add product ordering and payment features to the bakery website.

Add participant confirmation and event updates to the college fest website.

Improve visual consistency, navigation, and accessibility.

11. Conclusion

This project demonstrates how HTML and CSS can be used to build websites for personal, business, and college-event purposes. The Personal Portfolio website presents student information, the Sweet Cake Shop website displays bakery products, and the College Fest 2026 website shares event details and a registration interface. These projects provide a foundation for learning more advanced web development concepts.
